COGNITIVE COMPUTING ASSIGNMENT 11

WRITEUP DESCRIBING THE PROJECT :

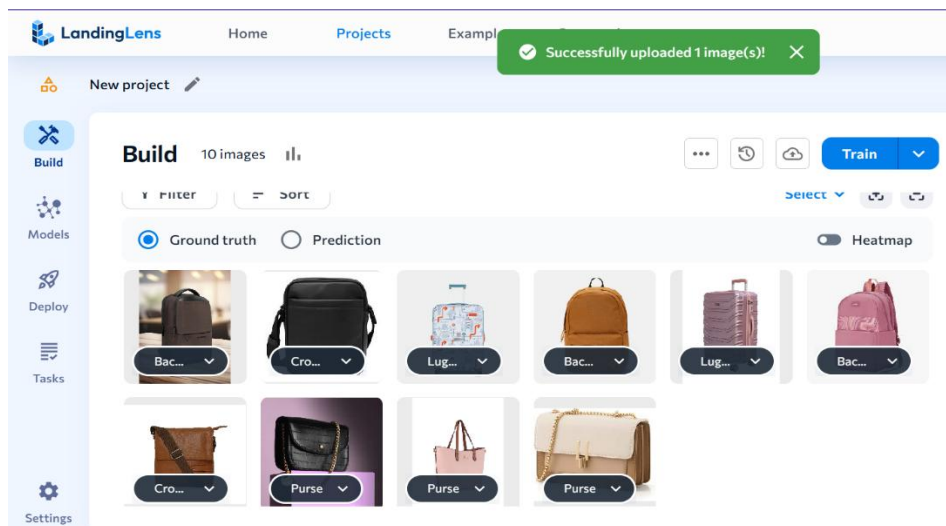

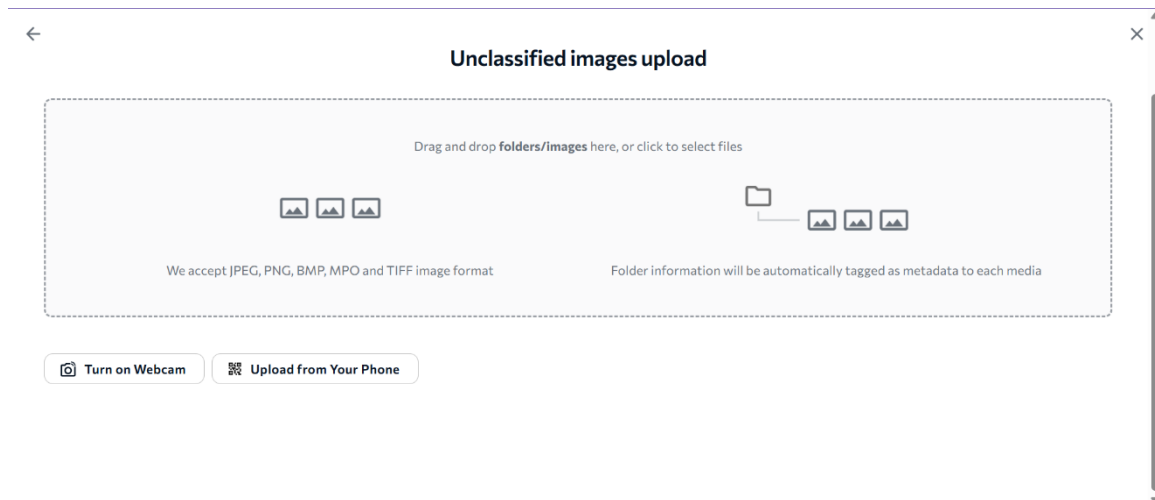

This project is a **classification model** built using the Landing AI platform, focused on identifying different types of **bags** based on their images. It uses labeled images of bags from **5 different categories (Backpack, Crossbody Bag, Luggage Bag and Purse)**, where each image represents a specific bag type. The model is trained to analyze the visual features of the bags and accurately predict the corresponding category. When given a new image, it correctly **classifies the bag** by its type based on its appearance. This showcases the potential of image-based classification in retail analytics and inventory management.
